FEDERCOSTRUZIONI

The strength of steel or stiffness of reinforced concrete are used in new connections or service facilities, or in defense of the ancient functions unsuitable to accommodate the historic building. Modern materials are neither systematically enhanced, or systematically discarded, but are composed, in metamorphism of the forms with traditional and historical, integrating the old with modern forms. This opens up several fields of research on the compatibility between conservation and use, the congruence between old and new structures, the ability of modern technology to replace traditional processes.
